

the first and *only* FDA-cleared test for

## Mycoplasma genitalium

now available at

### Doctors Pathology Services

First discovered in the early 1980s, Mycoplasma genitalium (M. genitalium) was listed as an emerging public health threat by the U.S. Centers for Disease Control and Prevention (CDC) in 2015. Although more common than gonorrhea, lack of public awareness of this STI has led to its rise in transmission and the serious, sometimes devastating health problems M. genitalium can lead to. One of the important causes of non-gonococcal urethritis, if left untreated infections can lead to infertility in women and an increased risk of HIV acquisition.

## COLLECTION METHODS

Aptima Multitest Swab	ThinPrep	Urine	Aptima Male Swab
			

**ORDER IN YOUR EMR LIKE OTHER STIs  
OR WRITE "MGen" ON THE REQUISITION**

- Industry leading turnaround times
- Results on one consolidated report
- Dedicated client care team with 24 hour access to a pathologist
- Advanced analytics platform
- IHC/ISH test catalog rivaling those of specialty labs
- More insurance carriers accepted than national labs
